Jothi Tutor Development Standards

MENTOR OBSERVATION STANDARD

Structured process for observing, coaching, and evidencing tutor development within the Jothi Tutor Academy

Author
Prakash Micheal
Jothi Learning, United Kingdom

Publication date
March 2026

Document ID
JTD04-1.0

Purpose of the Document

This document defines the mentor observation standard used within the Jothi Tutor Academy. Its purpose is to ensure that mentor observation is structured, evidence-based, developmentally useful, and aligned with the academy's wider tutor development system.

Mentor observation is not intended as casual lesson watching or informal opinion sharing. It is one of the academy's main tools for helping tutors improve through clear feedback, supported reflection, and professional judgement grounded in real teaching evidence. Strong observation helps tutors understand what they are doing well, where student thinking is not yet being handled effectively, and what the next improvement priority should be.

This standard exists to make mentor observation consistent across the academy and to ensure that observation serves both coaching and quality assurance without becoming vague or overly bureaucratic.

Intended Audience

This document is intended for:

- mentors conducting lesson observations within the Jothi Tutor Academy
- tutors receiving observation feedback as part of their development
- academy leadership overseeing tutor quality, developmental consistency, and readiness decisions

1. Purpose of Mentor Observation in the JTA System

Mentor observation is one of the academy's core developmental processes. It helps ensure that tutor growth is based on real lesson evidence rather than self-perception, isolated success, or general impression.

Through observation, mentors are able to:

- identify strengths in live teaching
- detect weaknesses or emerging risks in lesson delivery
- provide focused coaching
- recognise evidence of competency development
- support decisions about readiness for greater responsibility
- contribute to certification and sign-off processes where appropriate

Observation therefore serves both development and standard maintenance. Its primary orientation should remain developmental, especially during residency and early-stage teaching growth.

2. Principles of Effective Mentor Observation

Mentor observation within the academy should be guided by the following principles:

- observation should focus on teaching behaviour, not personality
- feedback should be evidence-based rather than impressionistic
- coaching should be specific enough to influence the next lesson
- observation should support growth, not merely judge performance
- strong performance should be recognised as clearly as weakness
- sign-off contribution should be based on repeated and credible evidence

These principles help preserve the seriousness of the process while keeping it useful for tutor development.

3. Relationship to the Wider JTA System

Mentor observation operates within the wider architecture of the JTA system.

- **JF03** defines the 4T Teaching Engine that mentors should look for in live teaching.
- **JTS01** defines the lesson delivery standard against which teaching practice can be judged.
- **JTD01** defines the competencies that may be evidenced through observation.
- **JTD02** captures the tutor's own reflection on the lesson.
- **JTD03** locates observations within the residency pathway.
- **JTD06** uses observation evidence as one part of certification and sign-off decision-making.

Mentor observation is therefore not a standalone activity. It is one of the main ways that teaching quality and tutor development are linked together.

4. When Mentor Observation Should Take Place

Mentor observation should normally take place when the tutor is actively engaged in teaching and there is meaningful lesson behaviour to observe.

This may include:

- co-teaching lessons
- lead teaching lessons
- independent teaching lessons
- specific developmental observations where a mentor is reviewing a targeted teaching skill

Observation is most useful when there is enough live teaching evidence for the mentor to judge explanation, questioning, responsiveness, and lesson structure meaningfully.

Observation-only lessons, in which the tutor is merely watching a mentor teach, do not normally require a full mentor observation record. Those situations are better captured through tutor reflection or mentor discussion unless a specific developmental reason exists.

5. What Mentor Observation Should Focus On

Mentor observation should focus on live teaching practice that matters instructionally. The main purpose is not to comment on style preferences, but to examine whether teaching is helping learning.

Core areas of focus include:

- clarity of explanation
- diagnostic questioning
- monitoring student thinking
- correction of misconceptions
- overall lesson structure and flow
- student engagement in thinking
- professional conduct where relevant to lesson quality

These areas should be judged in relation to the Jothi teaching model rather than personal preference alone.

6. Observation Through the 4T Teaching Engine

The 4T Teaching Engine provides a strong observation lens for mentors.

Teach

The mentor considers whether the tutor explained the concept clearly, logically, and at a usable pace.

Test

The mentor considers whether the tutor asked questions or used tasks that genuinely checked understanding.

Track

The mentor considers whether the tutor noticed how the student was thinking, including hesitation, confusion, weak reasoning, or recurring error.

Transform

The mentor considers whether the tutor responded to misunderstanding in a way that improved clarity and moved the student toward stronger understanding.

Using the 4T structure helps mentors keep feedback aligned to the academy's instructional core.

7. Evidence-Based Observation

Observation should be grounded in specific lesson evidence. Mentors should aim to refer to identifiable moments from the lesson rather than making broad unsupported claims.

Useful forms of evidence include:

- exact or near-exact tutor wording
- the nature of the questions asked
- specific student responses
- visible errors or hesitation
- the point at which misunderstanding became clear
- the way correction was handled
- the structure of the lesson as it unfolded

Evidence-based observation makes feedback more credible and more useful to the tutor.

8. Identifying the Strongest Aspect of the Lesson

Mentors should normally identify at least one clear teaching strength visible in the lesson.

This matters because effective development requires tutors to know not only what to improve, but also what strong practice is beginning to emerge.

The strongest aspect may relate to:

- one of the 4T elements
- a specific teaching skill

- a moment of clear explanation
- a strong diagnostic question
- effective handling of misconception
- lesson flow or student engagement

Recognising strengths helps developmental feedback remain balanced and accurate.

9. Identifying the Main Improvement Priority

Mentors should normally identify one main area for improvement rather than producing an unfocused list of many weaknesses.

A strong improvement priority should be:

- clearly linked to lesson evidence
- specific enough to guide the next lesson
- realistic for the tutor's current stage of development
- focused on an area that will improve teaching meaningfully

Examples might include:

- asking stronger diagnostic questions after each worked example
- pausing to check student reasoning before moving on
- making misconception correction more explicit
- slowing explanation when introducing a new method

Specific improvement priorities are more useful than broad criticism.

10. Observation Form Expectations

The mentor observation form should capture the main information needed to support development and, where appropriate, contribute to sign-off evidence.

The form should normally include:

- mentor name
- tutor name

- date
- subject
- year group
- lesson topic
- strongest 4T element observed
- area most needing improvement
- key teaching skill demonstrated
- evidence from the lesson
- overall mentor confidence rating
- one main target before the next lesson
- whether the lesson should contribute to sign-off
- the competency or skill relevant to sign-off where appropriate
- additional mentor note where necessary

This structure allows the form to support both coaching and developmental record-keeping.

11. Relationship to Tutor Reflection

Mentor observation and tutor reflection are closely related, but they serve different functions.

- **Tutor reflection** captures the tutor's own understanding of the lesson.
- **Mentor observation** captures an external, evidence-based developmental view.

These two forms should inform one another without becoming duplicates. Where tutor self-perception and mentor observation differ, that difference may itself be useful for coaching.

The most valuable developmental conversations often arise when reflection and observation are read together.

12. Relationship to Competency Development

Mentor observation is one of the main sources of competency evidence within the academy.

Observation may help show that a tutor is:

- beginning to demonstrate a competency
- developing consistency in a competency
- still insecure in an important area
- ready for greater responsibility in residency
- building evidence toward sign-off or certification

However, competency recognition should not normally be based on one strong lesson alone. Mentors should look for repeated and credible evidence across time.

13. Relationship to Sign-Off and Certification

Not every observation contributes directly to sign-off. Many observations are primarily developmental and should remain so.

Where a lesson provides clear evidence of competency demonstration, the mentor may indicate that the observation contributes to sign-off. This should be done with care.

A sign-off contribution should usually mean that:

- the relevant skill was clearly visible
- the quality of demonstration was credible
- the evidence aligns with the competency framework
- the judgement is not based on impression alone

Final certification decisions should still draw on wider evidence across the tutor's development, not one observation in isolation.

14. Confidence Rating and Mentor Judgement

The observation form may include a confidence rating to show how confident the mentor is in the tutor's current lesson performance or developmental readiness.

This can be useful because it gives a quick signal of mentor judgement, especially when read alongside written evidence. However, the confidence rating should not replace explanatory feedback. It is a summary indicator, not a substitute for evidence.

A mentor should be able to justify the confidence rating through what was actually observed in the lesson.

15. Common Observation Errors

The following observation errors should be actively avoided:

- giving vague praise without specific evidence
- giving criticism that is too broad to act on
- focusing on personal style rather than instructional value
- commenting mainly on confidence or personality instead of teaching behaviour
- identifying too many next steps at once
- using one lesson to make overconfident sign-off decisions
- failing to distinguish between a developmental observation and sign-off evidence
- writing feedback in a way that the tutor cannot clearly use

These errors reduce the developmental value of the observation process.

16. What Good Observation Practice Looks Like

Strong mentor observation should feel:

- focused
- fair
- specific
- developmentally useful
- aligned to the Jothi model
- sustainable to use regularly

A good observation record should allow someone reading it later to understand what happened in the lesson, what the mentor judged, and what the tutor should improve next.

17. Scaling and Form Design Considerations

Where live forms are used, the observation process should remain practical and scalable.

The academy should be cautious about over-hardcoding names, roles, or options in a way that creates maintenance difficulty as the number of tutors and mentors grows. Form design should support easy use without making the system brittle or overly manual.

This does not change the observation standard itself, but it matters for operational sustainability.

18. Relationship to the Wider JTA System

This standard supports the wider JTA framework by turning live lesson evidence into structured developmental input. It helps connect daily teaching practice to reflection, coaching, competency growth, readiness decisions, and final certification.

Without a clear mentor observation standard, the academy would still have teaching standards and competencies, but it would lack a reliable way to judge how those standards are appearing in real lessons.

Mentor observation therefore acts as one of the main quality-control and development bridges within the academy.

19. Conclusion

The Mentor Observation Standard exists to ensure that tutor observation within the Jothi Tutor Academy is structured, evidence-based, and genuinely useful for development. Mentors are expected to observe teaching with clarity, identify

meaningful strengths and weaknesses, and provide feedback that supports real instructional improvement.

Its role is not only to judge teaching. Its role is to help build better tutors through disciplined observation, focused coaching, and credible evidence of growth.
